

Scenario: Library Conversion from SirsiDynix to Polaris ILS

Issue: ILS Integration with Library Card Authentication for NLE Library Wireless Controller

Solution: SIP2 Authentication Server changes (via Polaris), and SIP2 Server Re-configuration (via NLE).

Background:

A common issue with Library conversions from a SirsiDynix ILS product to a Polaris ILS product is the desire to retain the use of library card authentication on the NLE Library Wireless Controller (Bluesocket Controllers).

It is possible to keep the library card authentication, however there are minimum requirements for both Bluesocket hardware and software. Also, there are required changes that must be made to the SIP2 server and Wireless Controller settings.

Solution Steps and Minimum Requirements:

- Polaris support engineers will need to make the appropriate SIP2 Server changes.
- NLE will work with the Library to make the required software and configuration changes to the Controller. An existing service contract is required, or a new service engagement can be purchased to perform the work.

The minimum hardware and software requirements are:

- BSC-600, BSC-1200, BSC-2100, or BSC-2200
- Software version 6.4 or higher

If the Library is using equipment not listed above or has equipment that has reached its "End-of-Support" status, NLE will work with the appropriate staff to review all upgrade options available.

The Solution:

NLE's ILS Migration

Service will provide the Library with the resources and WLAN configuration changes required to make the ILS transition smooth.

We will work with both the library staff and your ILS vendor to provide the necessary consulting and authentication decisions to minimize the effect of the migration on your customers.

To Purchase:

- **ILS Migration Services**
- **Potential Hardware Upgrades**

ILS Migration Services can be purchased for **\$595**.

Let NLE help make your next ILS migration a less stressful event.
